Purpose: This module defines the [Book](#) class for a digital library inventory system, allowing for tracking of titles, authors, and availability.

Author: Gautham Krishnamurthy

Date: May 2, 2026

Classes

[builtins.object](#)

[Book](#)

class **Book**([builtins.object](#))

[Book](#)(title, author, pages, status='Available')

Represents an individual book within the library's digital inventory.

This class tracks bibliographic data and the current lending status of a specific book instance.

Methods defined here:

`__init__`(self, title, author, pages, status='Available')

Initializes a new [Book](#) instance.

Args:

title (str): The full title of the book.

author (str): The name of the book's author.

pages (int): The total number of pages in the book.

status (str): The current status (Available, Checked Out, or Reserved). Defaults to "Available".

`calculate_reading_time`(self)

Calculates the estimated time required to read the book.

Calculations are based on an average reading speed of 1.5 minutes per page.

Returns:

float: The estimated reading time in hours.

`get_details`(self)

Generates a formatted summary of the book's information.

Returns:

str: A string containing the title, author, and current status.

`update_status`(self, new_status)

Updates the availability status of the book.

Args:

 new_status (str): The new status to be applied to the book.

Returns:

 None

Data descriptors defined here:

__dict__

 dictionary for instance variables (if defined)

__weakref__

 list of weak references to the object (if defined)
